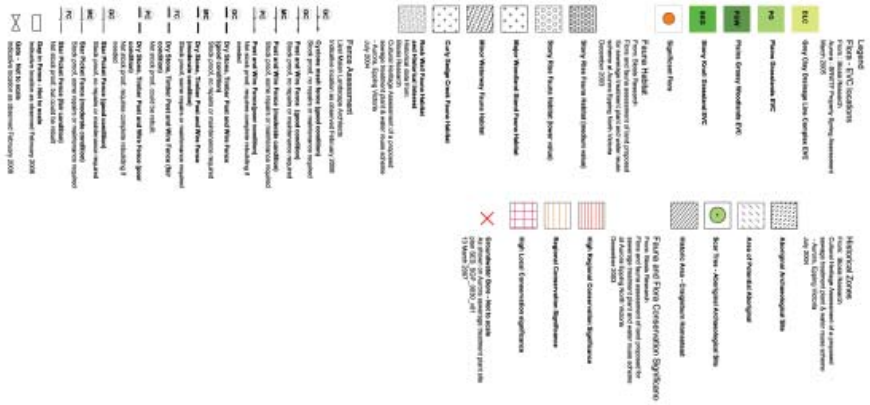
Aurora sewage & water recycle facilities
Epping

Our involvement in Aurora sewage and water recycling facilities was to turn multiple reports, on Ecological Vegetation Classes, conservation of fauna and flora, habitat value and heritage, as well as an existing conditions assessment, into an overall plan.


This plan successfully consolidated the complex discussion between multiple reports by several organisations into a single document. The plan went through a process of filtering, ordering and prioritising of the report data. This ensured that the plan was comprehensive while still a focussed and readable document. The graphic presentation of the spatial relationships of the reports findings gave the client an whole site picture. By overlaying a range of data it revealed important links and issues for the management of this site.
